PROFESSIONAL SUMMARY

Full-stack Software Development Lead with 7+ years of experience designing and operating distributed systems, event-driven microservices, and high-throughput data platforms. Proven track record owning technical and architectural vision end-to-end — from API gateways and messaging-system design (Kafka, RabbitMQ, Pulsar) through SQL/NoSQL data layers, caching, serverless runtimes, and containerized deployment on OpenShift. Builds with observability (Prometheus, Grafana, OpenTelemetry) and secure coding practices in mind, using React and Angular on the frontend. Experienced leading design reviews, driving cross-functional alignment with stakeholders, mentoring engineers, and establishing coding and design best practices while balancing business needs with engineering trade-offs.

CORE SKILLS

Languages & Frameworks: TypeScript, JavaScript, React JS, Angular, Node.js, Express JS, GraphQL, Java, Spring Boot (MVC), Python, FastAPI, LangChain

Distributed Systems & Messaging: Microservices, Event-Driven Architecture, Kafka, RabbitMQ, Pulsar, Apache Flink, API Gateways, REST APIs, Async/Callback Systems, A2A Agent Protocols

Data & Caching: PostgreSQL, Oracle SQL, MongoDB (NoSQL), Redis, Caffeine in-memory caching, caching-layer design

Cloud & DevOps: AWS, Serverless Runtimes, Docker, Kubernetes, Podman, Apache OCP, Linux, CI/CD-driven containerized deployment pipelines, Git-based workflows

Observability & Security: Prometheus, Grafana, OpenTelemetry, Secure Coding Practices, Monitoring, retry handling & failure recovery, load testing & performance tuning

Reliability & Practices: Design reviews, code reviews, cross-functional stakeholder collaboration, sAFE Agile Certified

Testing & Orchestration: Cypress, JUnit, Task Orchestration (Prefect, Netflix Conductor), System Design

AI Tools & Platforms: GitHub Copilot, Claude, Claude Code, Google Gemini, GPT, Llama

PROFESSIONAL EXPERIENCE

Software Development Lead – Verizon **Nov 2019 – Present**

Own technical and architectural vision for full-stack delivery across four major Verizon platform initiatives (NSP, 5G Professional Setup, HNM, AN 360), building distributed, event-driven systems across TypeScript, React, Node.js, Express, GraphQL, Java Spring Boot, Python/FastAPI, Kafka, Flink, Pulsar, RabbitMQ, Redis, Oracle SQL, Docker, and Kubernetes on OpenShift.

AN 360

- Owned a core module of AN 360 end-to-end, a system that ingests network events across a distributed pipeline, groups them by category, identifies the root-cause event per cell site, and auto-generates a single consolidated ticket per event family — reducing duplicate ticket noise for operations teams.
- Engaged directly with stakeholders and cross-functional teams to gather feedback, participate in design reviews, and shape product direction for the module owned end-to-end.
- Built a high-throughput event ingestion pipeline (Apache Flink, Kafka, Spring Boot) capable of processing large-volume Kafka message streams, then re-architected it toward a monolithic ingestion layer to isolate ingestion from downstream processing and improve fault tolerance.
- Built high-performance, full-stack backend services spanning Node.js/Express, Java Spring Boot, and Python FastAPI; introduced Caffeine in-memory caching that improved application performance by roughly 3x.
- Ran load tests and optimised API and SQL database query paths, cutting both API response time and query execution time by approximately 50%.
- Orchestrated distributed workflows using Prefect and Netflix Conductor.
- Developed a supervisor Agent with LangGraph, successfully integrating multiple subagents via Google’s agent-to-agent protocol for seamless collaboration and execution.
- Built async, callback-based services in Spring Boot to reliably integrate with slow-responding external systems without blocking core workflows, establishing coding and design best practices along the way.

- Engineered CI/CD workflows leveraging GitLab Runners, and Docker to streamline containerisation and deployment of services to Kubernetes and OpenShift establishing reliable and repeated release cycles.

Home Network Management

- Built Home Network Installation APIs using the Play Framework and developed workflows supporting installation, reset, and troubleshooting flows for home network devices.
- Delivered a proof of concept for task orchestration using Prefect, evaluating it as a workflow engine for the broader distributed platform.

5G Professional Setup

- Designed and built a technician-facing dashboard and mobile app (React JS, Tailwind CSS) for field installations and repairs; optimized the workflow so installations consistently completed in under 8 minutes.
- Architected a Vendor Management System (Express JS, GraphQL, Oracle SQL/PL packages) that automatically routes incoming 5G orders to the right vendor based on weighting, priority, and order type.
- Designed a Task Orchestration platform (Express JS, TypeScript, Oracle SQL) to run background workflows asynchronously, with built-in monitoring and observability (Prometheus, Grafana, OpenTelemetry), retry handling, and automated failure recovery.
- Built an end-to-end order traceability system with a retry mechanism (gRPC, Express, Node.js, React, TypeScript) for reliable inter-service communication across the distributed platform, giving stakeholders full visibility into order status.
- Built a centralized, app-level caching module shared across microservices that auto-refreshes configuration data on database change, reducing redundant DB calls.
- Migrated the deployment pipeline to a containerized, CI/CD-driven architecture using Podman and Kubernetes, routed traffic through API gateways, adopted AWS serverless runtimes for select workloads, and integrated AWS for image storage and retrieval, following secure coding practices throughout.

NSP

- Built a network operations dashboard giving NRB technicians real-time visibility into distributed network services and underlying APIs, replacing manual troubleshooting lookups with a unified interface.

Software Developer – Caterpillar **May 2019 – Nov 2019**

- Migrated a legacy PHP machinery-stats management dashboard to React JS, Node.js, Express JS, and MS SQL, aligning the rebuilt full-stack app with updated design patterns and UX standards.
- Wrote Cypress test coverage to validate the application end-to-end and ensure production readiness as part of the CI/CD and code review process.
- Ran regular design review calls with stakeholders and iterated on the UI based on direct feedback; optimized both API and frontend performance for speed.

Software Developer Intern – Centinal Spark Technologies **Mar 2016 – Mar 2017**

- Worked as a frontend engineer (React JS, JavaScript, HTML, CSS, Bootstrap) on a truck management platform used to track trucks, trips, pricing, and load assignments.
- Revamped the application from a legacy HTML codebase into a modern React JS interface, applying current design and UX best practices.

EDUCATION

M.S., Computer Science – New Jersey Institute of Technology, Newark, NJ (2019)

B.Tech, Electronics and Communication Engineering – Jawaharlal Nehru Technological University, Hyderabad (2017)
